

Managed Mobility Services

Asignet's patented platform combines RPA (Robotic Process Automation) integration, Hyperautomation and customized workflow development to deliver unparalleled savings, unprecedented efficiency, and the industry's most comprehensive and accurate reporting and analytics.

Asignet's Hyperautomated Managed Mobility

Asignet automates the entire MMS procure-to-pay lifecycle.

Our hyperautomated RPA technology integrates with the mobile carrier billing information and compares this data to your vendor contacts and user's service information.

MMS Hyperautomation brings automation to the entire mobile lifecycle, from device selection under an approved contract in all countries where your organization operates, to data plan optimization and provisioning management based on the real usage of each individual.

Ordering Provisioning and End-Point Management

This patented technology supports the provisioning, endpoint management, and deployment of all mobile services from personal devices, mobile data services, SIMs, and IoT edge devices (including connectivity modules and LTE and 5G SD-WAN routers). The platform utilizes configurable policy driven rules to manage entitlements and deployment rules.

Inventory Management and Usage Management

Asignet's hyper automated Inventory management for mobile data services and IoT edge devices includes an RPA driven inventory module that detects differences between real-time inventory, policy-driven MACD activity, and what was billed. Our real-time usage management capability ensures that every individual will have access to their lifecycle management data. This process significantly improves productivity and drives down expenses.

Invoice and Contract Management

Asignet's technology automates the processing and payment functions for all

service invoices, including loading, allocation of charges, approval, audit compliance, A/P and vendor payment, business operations, and external financial systems integration.

Dispute Management

Effective dispute management processes ensure recovery of erroneous service costs, SLA compliance and applicable violation credits, and management of short-pay and no-pay decisions related to network services.

Asignet's system and managed services will seamlessly manage the process of filing disputes with carriers, effective collaborative communication through our interactive Vendor portal, ensuring the recovery of credits, and helping organizations optimize expenditures and improve cash flow.

Hyperautomated MMS guarantees consistent universal experiences regardless of how, when, or where customers initiate a transaction.

Asignet's Patented Mobility Managed Services solution allows you to take full control of your company's mobile strategy by hyperautomating & connecting technology, business processes, and people.
